20. Defining And opening file :

We must specify the following details to the files

1. File name
2. Data Structure
3. Purpose

File Name:

⇒ File name is a string of character

⇒ It should be a valid name

⇒ File name consists of two parts

namely

* Primary name

* An optional period with extension

Example:

Sowdewari.txt

Sample.c

Data structure :

⇒ It is defined as file in the library of standard I/O function definitions

⇒ All the files should be declared as type FILE before they are used

⇒ FILE is defined as data type.

⇒ Fp - pointer to the data type FILE

⇒ FILE is a structure that is defined in the I/O library.

Purpose :

The mode indicates the purpose of opening the file.

21. b) Reading and writing c character:

The simplest of all input/output operations is reading a character from standard input unit and writing it to the standard output unit.

Reading single character can be done by using the function `getchar`.

Variable-name = `getchar(c);`

When this statement is encountered, the computer waits until a key is pressed and then assigns this character as a value to `getchar` functions.

EX: `char name;`

`name = getchar(c);`

a) String Handling Function:

The C library supports a large number of string-handling functions that can be used to carry out many of the string manipulations. Following are the most commonly used string handling functions.

Function	Action
strcat()	Concatenates two strings
strcmp()	Compares two strings
strcpy()	Copies one string over another
strlen()	Finds the length of a string.

Combining strings together

The `strcat` function concatenates the string 2 to the end of the string 1. The general format is

`strcat(string 1, string 2);`

where `string 1` and `string 2` are the name of the string variables.

Comparing two strings:

The `strcmp` function compares two strings and find out whether they are same or different. If two strings are equal, this function return a value zero

otherwise, the numerical difference

between the first non-matching character is returned. The general format is

`strcmp(string1, string2);`

where, `string1` and `string2` are the name of the string variables.

This compares the left-most `n` character of `string1` and `string2` and returns

- * 0 if they are equal

- * negative number, if `string1` sub string is less than `string2` and

- * positive number

the contents of one string into another. The strcpy function works like a string assignment operator.

The content of string 2 is copied to string 1. The general format is

strcpy(string 1, string 2)

Where string 1 and string 2 are character arrays.

Finding the length of a string:

The strlen() function counts and returns the number of character in a string. it takes the form,

n = strlen(string);

21. A) Copying and comparing structure

Variables:

Two Variables of the same

Structure type can be copied the same way as ordinary variables.

If person1 and person2 belong

to the same structure, then the

following statements are valid

person1 = person2;

person2 = person1;

However, the statements such as,

person1 = person2

person1! = person1!

ATTESTED

The above statements are not permitted. C does not permit any logical operations on structure variables

In case, we need to compare them, we may do so by comparing members individually.

Program:

```
#include <stdio.h>
```

```
#include <conio.h>
```

```
void main()
```

25) b) Random access files :

It is used to access only particular part of a file and not in reading with other parts. This can be achieved by the following function

⇒ ftell()

⇒ rewind()

⇒ fseek()

ATTESTED

 PRINCIPAL

 TIRUCHENGOORE - 637 205.

⑬

ftell function()

⇒ It takes a file pointer as input and return a number of

bytes long, that corresponds to the current position.

⇒ The function is useful in saving the current position of the file.

Syntax of ftell() function is

$$n = \text{ftell}(fp)$$

⇒ n indicates the relative offset of the current position.

rewind() function:

⇒ It takes a file pointer and

ATTESTED

PRINCIPAL

SENGUNTHAR ARTS AND SCIENCE COLLEGE

reset the position to the start of the file.

⇒ The first byte in the file is numbered as 0, second as 1 and so on

⇒ A file is opened for reading or writing, a rewind is done simply

Example:

```
rewind(fp);
```

fseek() function:

⇒ It is used to move the file position to a desired location within the file.

The syntax of fseek() is given by

```
fseek(file_ptr, offset, position)
```

⇒ File ptr → it is a pointer to the file concerned.

⇒ Offset → it is a number or variable of type long. It specifies the number of positions to be moved from the location specified by the position.

⇒ Position → It is an integer number must take the value given below.

⇒ When the operation is successful, fseek returns a zero.

82 ⇒ If we attempt to move the file pointer beyond the file boundaries, an error occurs and fseek returns -1.

- * Mini computer
- * Super computer
- * Network computer

Micro computer:-

⇒ Micro computer uses microprocessor as the basic CPU.

⇒ Microprocessor consists of integrated circuits contained on LSI chips.

ex ⇒ Acer, Aspire, compaq, Picasio, Intel.

Workstation Computer :

⇒ It is also single user computer.

⇒ Workstations are recently used computer.

⇒ It is very expensive & powerful computer.

⇒ It is mainly used by engineers & scientists.

⇒ Most powerful workstation called Super micro.

17. De Morgan's theorem:-

⇒ De Morgan's theorem allows large bars in Boolean expression to be broken up into smaller bars over individual variables.

⇒ De Morgan's theorem says that large bar over several variables can be broken between the variables at the sign between the variables is changed.

⇒ De Morgan's theorem can be used to prove that NOR gate is equal to AND gate with inverted inputs.

⇒ De Morgan's theorem can be used to prove that (NAND) gate is equal to OR gate with inverted inputs.

⇒ In order to put reduce expression with large bars must first be broken up. This means the first step in reducing an expression is to use De Morgan's theorem.

⇒ It is highly recommended to place parentheses around **ATTESTED** where lines have been broken.

$$\overline{AB} = \overline{A} + \overline{B}$$

$$\overline{A+B} = \overline{A} \overline{B}$$

example:-

⇒ Apply De Morgan's theorem to remove over bar covering both terms from the expression $x = \overline{C+D}$

⇒ To apply De Morgan's theorem to expression, you can break overbar covering both terms and change the sign between the terms. This results in $x = \overline{C} \overline{D}$. Deleting the double bar gives $x = C \cdot D$.

De Morgan (cont).

$$x = C(A+B) + D$$

⇒ Applying De Morgan's theorem and the distributing law:-

$$x = C(\overline{A} \overline{B}) + D = \overline{A} \overline{B} C + D$$
